

Capture and forwarding of SONET/SDH/BIGE traffic snapshots

Capture times
for raw traffic:
003: 51.2 secs
0012: 12.8 secs
0048: 3.2 secs
BIGE: 8.0 secs

OptiCop captures and records into its memory selected live snapshots of SONET/SDH or BIGE network traffic. The start and content of the capture process is determined by traffic filters. Capture times may be extended through the filtering of unwanted traffic types or TDM streams. The snapshots are then forwarded to traffic processing/storage over BIGE lines.
